Insulin Management in the Hospital Setting

J.R. Manderville BSc (Pharm)
MTU pharmacist
QEII HSC
April 2011
Disclosures: none
Overview of presentation

- Review of different types of insulin
- Focus on newer agents
- Insulin administration
- Standing orders
What percentage of medication errors result from insulin misadministration?

- 2%
- 5%
- 11%
- 42%

Insulin

• Insulin is identified as 1 of top 5 “high risk medications” in the hospital setting

• CDA 2008: Healthcare institutions should have a systems approach to reduce errors which include preprinted orders... and unambiguous standard orders for insulin administration.
How does the “normal” pancreas release insulin throughout the day?
Physiological Serum Insulin Secretion Profile

Plasma insulin (µU/ml)

Time-action profiles of bolus & basal insulins

Diagrammatic representation

Action curves are approximations taken from different data sources. Actual patient response will vary.
Lispro, aspart, and glulisine (vs regular insulin)

- More “physiologic”
- Administration at mealtime (no waiting)
  - Convenience factor
  - Allows flexibility with timing of meals.

- If child or demented pt, can administer after meal.
Basal/Bolus Treatment Program with Rapid-acting and Long-acting Analogs

Plasma insulin (μU/mL)

- Aspart or Lispro
- Glargine or Detemir
Lispro, aspart, and glulisine (vs regular insulin)

- ↓ risk of late hypoglycemia.
- Possibly better control of postprandial hyperglycemia.
- Agent of choice for SS (?)
- Less chance of stacking.
- I have no preference between the 3 analogs.
Lantus and Levemir (vs NPH)

- More “physiologic”.
- Less nocturnal hypoglycemia (major advantage).
- Not better at lowering HbA1c.
- Less intra individual variability.
Treat To Target trial

Documented bg $\leq 4$ mmol/L

Documented bg $\leq 3.1$ mmol/L

*Diabetes Care* 26:3080–3086, 2003
Symptomatic Hypoglycemic Events: Glargine vs NPH

*P<0.05 vs insulin glargine.
Adapted from Riddle M et al. *Diabetes Care.* 2003;26:3080-3086.
What do I mean by intra patient variability?

NPH 0.4 unit/kg action for 1 patient on 4 different days. All other factors controlled.
### Premixed insulin

<table>

</table>
Case: new admission

• Order reads:
  ○ NPH 13 u QAM 22 u QPM

• Why might I consider this to be an "unacceptable" order?
Case: new admission

• Order reads:
  o NPH 13 u QAM 22 u QPM

• What is “PM”?
  o very important re premixed insulin (ie 30/70)
  o HS NPH may be preferred over supper.
  o But what was pt doing at home? What is she willing to do?
Intended dose of 4 units interpreted as 44 units.
Abbreviations

• Use “units”
  o Not IU
  o Not U

  o “U” has also been misread as “cc”

    ▪ ie ↑drip rate by 2u/h could be misread as 2cc/h.
60 units or 60 units?

3 international units or 31 units?

BMJ 2010;341:c5269
10 units or 100 units? 3 international units or 31 units or 310 units?

BMJ 2010;341:c5269
Other cautions

• Don’t refer to long acting insulin as “the cloudy insulin”
  - Lantus and Levemir are clear.
Back to the case…

- Admitting order reads:
  - NPH 13 u QAM 22 u QPM

- Clarified to:
  - NPH 13 u QAM 22 u Qsupper

- QAM Chemstrip is > 12 for next 3 days.
- 0300h Chemstrip ordered.
  - Why?
NPH

- Supposed to act as a “basal” insulin…
- But it has a peak!

- NPH q supper peaks ~ 3 AM.
NPH at supper vs NPH at bedtime.

- **Insulin Effect**

  - **Peak at 2-4 am**
  - **Peak at 6-8 am**
Somogyi effect
NPH...

- HS NPH may be better than Q supper NPH
  - ↓ overnight hypos

However, if it ain’t broke, don’t fix it!

Orders for “PM” insulin should always be clarified.
Nursing student question

- AM sugar 6.9
- Patient due for NPH 62 units, R 22 units.

- Which insulin to hold?

This is a product of the sliding scale mentality, I suspect.
Why not sliding scales?

- Retroactive, not proactive.
- No evidence of benefit.
- In some instances, a “don’t call me” order.
- Glycemic control rarely assessed.
- Doesn’t provide basal insulin.
Is there no place for sliding scales?

• May have a role in some patients.
• Should generally not be used alone.
  o Especially in T1DM.
• Should be reassessed regularly.
Is there a “standardized” sliding scale?

• No.
• Consider BG of 20 in:
  o 92 YO 46 kg woman with dementia
  o 56 YO 192 kg male with sepsis in ICU
  o 18 YO male with T1DM and UTI

  ▪ All have different levels of insulin resistance and requirements.
Moving right along to our next admission

- KL, 68 YO woman with T2DM and CHF
- Using 30/70 for 4 years.
  - 16 units QAM 12 units qsupper

- Sugars:
  - AM 6-8
  - Lunch 5-6 (gets hypo if eats late)
  - Supper 10-14
  - Bed 4-7
• Why does she get hypo if she eats lunch late?
KL: why does she get hypo if she eats lunch late?
What are our options for KL to reduce her risk of pre lunch hypos?

AM 6-8
Lunch 5-6 (gets hypo if eats late)
Supper 10-14
Bed 4-7

KL was eventually changed from 30/70 to Humalog 25 mix at the same dose (16 units QAM; 12 units q supper).

Why does this make sense?
• Humalog 25 mix is:
  - 75% NPL (essentially NPH)
  - 25% Lispro (fast acting analog)

  - So, similar to 30/70, right?

  - But compare the profiles.
Remember, this is 30/70...
Here is the Humalog mix.
Quiz break...
What do we often forget to tell patients who start NPH via pens?
What do we often forget to tell patients who start NPH via pens?

- Resuspend the insulin!
- Roll the pen between the palms 10 times…
- Then invert it 180° 10 times.
- If not done, can lead to ↑↑↑ hypos!

  - Significant ↓ in hypoglycemic reactions after proper instruction.

Jehle et al. Lancet 1999;354(6)
Humulin N pen monograph/ insert
Insulin administration

• Can disposable syringes and needles be reused?

Manufacturer will no doubt say no. But ADA says yes. Smaller (30 gauge) needles may develop barbs easily.
Insulin administration

• Should the skin be swabbed with an alcohol swab before injecting a pen?

  This is not necessary for pens or syringe/needle.
Insulin administration

• Can pens be injected through clothing?

Sure.
What short acting insulins can be mixed with Lantus (glargine)?

• none
What short acting insulins can be mixed with detemir (Levemir)?

- none
Recent case: FR

- 79 YO man with long standing DM
- 130 lb

- h/o recurrent hypoglycemia; admitted for fall.

- ? gastroparesis; limited intake over last few days.

- Last A1c 7.8%
Recent case: FR

Home regimen:
- NPH 24 0 0 0 0
- R 10 0 2 0 0

In hospital:
- NPH 20 0 0 0 0
- R 0 0 0 0 0
Recent case: FR

• Several episodes of symptomatic hypoglycemic episodes in first 3 days in hospital (BG 1.3 on one occasion).
• Staff asks how to change to glargine.
• How to proceed?
Recent case: FR

- First things first:
  - Review chart.

Each AND EVERY episode of hypoglycemia was directly induced by hospitalization.
Recent case: FR

- Wednesday at 16:45: BG = 1.2.
- What do you suppose his sugar was at 11:50?
  
  11:50 BG = 22.1
  And what was done about this?

  10 units Novorapid sc x1
  What else do we need to know about noontime on Wednesday?

  He ate very little lunch, secondary to nausea.
• Each of the 3 cases of hypoglycemia in FR could **easily** be traced **directly back** to overzealous correction doses of insulin.
• I felt no need to \( \Delta \) him to Lantus.
5. **INSULIN CORRECTION DOSE ORDERS**

If pre-meal blood glucose is above 8 mmol/L, give the following **additional** subcutaneous doses with the regularly scheduled orders above using:

- Aspart (NovoRapid)
- Lispro (Humalog)
- Other ____________________

<table>
<thead>
<tr>
<th>Pre-meal blood glucose (*half-dose at bedtime)</th>
<th>□ Patients on a low dose regimen (receiving less than 40 units/day prior to admission)</th>
<th>□ Patients on a medium dose regimen (receiving 40–80 units/day prior to admission)</th>
<th>□ Patients receiving high dose regimen (receiving greater than 80 units/day prior to admission)</th>
</tr>
</thead>
<tbody>
<tr>
<td>8 to 10.9 mmol/L</td>
<td>1 unit</td>
<td>1 unit</td>
<td>2 units</td>
</tr>
<tr>
<td>11 to 13.9 mmol/L</td>
<td>2 units</td>
<td>3 units</td>
<td>4 units</td>
</tr>
<tr>
<td>14 to 16.9 mmol/L</td>
<td>3 units</td>
<td>5 units</td>
<td>7 units</td>
</tr>
<tr>
<td>17 to 20 mmol/L</td>
<td>4 units</td>
<td>7 units</td>
<td>10 units</td>
</tr>
<tr>
<td>Greater than 20 mmol/L</td>
<td>5 units</td>
<td>8 units</td>
<td>12 units</td>
</tr>
</tbody>
</table>

\* The above algorithm may be used for bedtime correction by using only \( \frac{1}{2} \) of the suggested insulin dose (rounded down to the nearest unit)

If blood glucose is less than 4.5 mmol/L pre-meal, and patient is taking the provided meal, **decrease** the regularly scheduled **pre-meal** insulin according to the following:

<table>
<thead>
<tr>
<th>Pre-meal blood glucose</th>
<th>□ Patients on a low dose regimen (receiving less than 40 units/day prior to admission)</th>
<th>□ Patients on a medium dose regimen (receiving 40–80 units/day prior to admission)</th>
<th>□ Patients receiving high dose regimen (receiving greater than 80 units/day prior to admission)</th>
</tr>
</thead>
